

Efficiently manage asset **maintenance** and recurring jobs with top-rated software.

Whether your maintenance contracts are based on assets, routines or standards, use simPRO to streamline asset maintenance and easily meet service level agreements. With features for preventative maintenance planning, recurring job tracking and asset scanning, you'll have everything you need to take your maintenance work to the next level.

### Create processes for recurring maintenance jobs

Cut out the manual administrative work involved in tracking recurring jobs and automate your maintenance job management. The recurring jobs template in simPRO is designed specifically for maintenance work performed at regular intervals. Save time by adding your job details, materials and labour to the template, and set an alert to signal when an asset is due for servicing.

### Test and manage assets in the field

Make it easy for field staff to test assets on site. simPRO Mobile allows field staff to use the camera from their mobile device or tablet to scan asset barcodes and QR codes in any order while testing to cut down on search time. Easily view all previous asset test history including results, readings, failure points, recommendations and notes. Field staff can also conduct a site audit, capture asset details, and receive prompts to complete mandatory readings when attempting to pass all untested assets. Once testing is complete, simply email the job card to the office for complete office-to-field connectivity.

### Key Features

- Asset management
- Workflow automation
- IoT solutions
- Business reporting
- QR and barcode scanning
- Customer relationship management
- Inventory management
- Accounting integrations
- Implementation & training sessions
- Live customer support
- Multi-company management

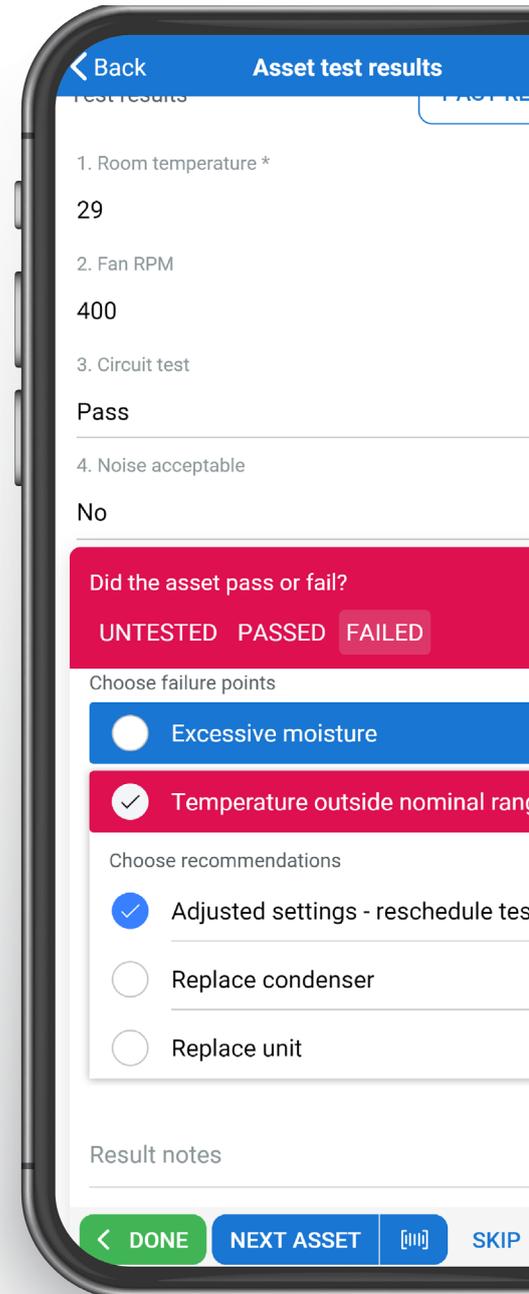

## Streamline preventative maintenance contracts

Use simPRO's Maintenance Planner to determine in advance which customer assets need to be tested and which service level is being performed. Keep your asset records detailed, up-to-date and easily accessible so you can best monitor your preventative maintenance jobs and schedule field staff accordingly. This automation feature simplifies the process of managing service level agreements by providing alerts when an asset is due for maintenance or fails testing. The alert then triggers job creation in simPRO by using a pre-fill feature to populate the job fields with asset record data. Track your maintenance contract activity, costs and income from one database to provide the best possible customer service.

## Organise invoicing for recurring jobs

Avoid wasting time creating invoices from scratch for recurring maintenance jobs. With the Recurring Invoice feature in simPRO, simply add your parts and labour to the invoice template and set a frequency to receive alerts to invoice the customer at regular intervals. If your labour rates or other pricing change, you can easily make updates to these templates in bulk.

*Some of these actions may require the Maintenance Planner add-on.  
Ask your Business Development Manager for more information.*

## 5,500+ businesses trust simPRO for field service management

*“For our business, Asset Management is an important factor. With simPRO, we have been able to record accurate asset lists and then implement standardised checks so that our technicians across the country are all doing the correct checks every month, quarter and year.”*
